

Technical Test

Task:

Build a microservice application that has a number of API endpoints;

- Microservice
 - List of items in a table (Fields: name, email)
 - Add/Edit/View/Delete of a given item in table
 - When an item is added, updated or deleted broadcast to other microservices (handling of the events or building of other microservices is not required)

Technology stack

- PHP framework of choice
- Test framework of choice
- Database of choice
- Docker preferred

Whilst building our application consider speed, data response structures, etc. Bonus for documentation
